INTEREST OF AMICUS CURIAE

The Chamber of Commerce of the United States of America (the “Chamber”) is the world’s largest business federation.¹ It represents 300,000 direct members and indirectly represents the interests of more than three million companies and professional organizations of every size, in every industry, from every region of the country. An important function of the Chamber is to represent the interests of its members in matters before Congress, the Executive Branch, and the courts. To that end, it regularly files amicus curiae briefs in cases raising issues of concern to the Nation’s business community, including the regulation and development of U.S. shale energy resources.

SUMMARY OF THE ARGUMENT

On March 26, 2015, the BLM issued a final rule designed to regulate hydraulic fracturing on federal and Indian lands. *See* 80 Fed. Reg. 16,128 (Mar. 26, 2015) (the “BLM rule”). As a threshold matter, the district court correctly held that “Congress has directly spoken to the issue and precluded federal agency authority to regulate hydraulic fracturing not involving the use of diesel fuels.” Final Order (“Order”) at 9 (June 21, 2016), Dkt. 207. In order to promote the

No person other than the amicus curiae, its members, or its counsel made a monetary contribution to its preparation or submission. All parties have consented to the filing of this brief.

development of domestic oil and gas resources, Congress expressly withheld from EPA—the federal agency with principal responsibility for environmental regulation—the authority to regulate hydraulic fracturing. Given that fact, it is inconceivable that Congress would nevertheless have intended for the Department of the Interior to exercise the same authority under broad, catchall statutory provisions that nowhere mention hydraulic fracturing.

Under the framework set forth in *Chevron U.S.A., Inc. v. Nat. Res. Def. Council, Inc.*, 467 U.S. 837 (1984), this dispositive finding is the end of the inquiry. But even if the agency had been acting within the scope of its authority, the Court should affirm the district court on the alternative ground that the BLM rule is an arbitrary and capricious exercise of agency decisionmaking.

The BLM rule is arbitrary and capricious because the agency failed to set forth a reasoned basis for its action. It failed to substantiate that there is a regulatory gap under state law, or extant safety concerns, that its rule was necessary to address. The agency also failed to provide reasoned explanation sufficient to support the efficacy of its approach, and vastly underestimated the costs of compliance to U.S. businesses. Further, it failed to balance the significant benefits of hydraulic fracturing with respect to the U.S. economy, individual consumers, and U.S. energy security—benefits that the BLM rule would diminish. Instead, the agency proposed a solution in search of a problem. The BLM

unnecessarily intruded into an already heavily regulated area, and sought to impose an additional layer of overlapping federal regulation that duplicates (and at times contradicts) the existing regulatory framework, without identifying any benefits that would exceed the significant costs of the BLM rule.

ARGUMENT

I. CONGRESS HAS NOT DELEGATED TO DEPARTMENT OF THE INTERIOR THE AUTHORITY TO REGULATE HYDRAULIC FRACTURING.

The district court correctly determined that Congress has not delegated the authority to regulate hydraulic fracturing to the Department of the Interior or, indeed, to any other federal agency. Where a case involves an administrative agency's construction of a statute that it administers, the Court's analysis is governed by the framework set forth in *Chevron U.S.A., Inc. v. Nat. Res. Def. Council, Inc.*, 467 U.S. 837 (1984). "Under *Chevron*, a reviewing court must first ask 'whether Congress has directly spoken to the precise question at issue.'" *FDA v. Brown & Williamson Tobacco Corp.*, 529 U.S. 120, 132 (2000) (quoting *Chevron*, 467 U.S. at 842). "If Congress has done so, the inquiry is at an end; the court 'must give effect to the unambiguously expressed intent of Congress.'" *Id.* (quoting *Chevron*, 467 U.S. at 843). Where Congress has not specifically addressed the question, on the other hand, "a reviewing court must respect the agency's construction of the statute so long as it is permissible." *Id.*

Both appellants and their amici rely heavily on what they characterize as broad and long-standing delegations of general authority to the Department of the Interior. Yet as all parties appear to concede, none of the statutes put forth as a basis for this authority specifically address regulation of the hydraulic fracturing process or even the environmental effects of oil and gas extraction processes in general. And as the Supreme Court has observed, “the meaning of one statute may be affected by other Acts, particularly where Congress has spoken subsequently and more specifically to the topic at hand.” *Id.* at 133.

That is true here. Notwithstanding a broad grant of plenary authority, “it is a commonplace of statutory construction that the specific governs the general.” *Morales v. Trans World Airlines, Inc.*, 504 U.S. 374, 384 (1992). When Congress expressly considered whether federal regulation of hydraulic fracturing was necessary in the Energy Policy Act of 2005 (“EPA Act”), Pub. L. No. 109-58, 119 Stat. 594, it explicitly *withdrew* the EPA’s authority to regulate the practice. Given that fact, Congress could not have intended, *sub silentio*, for another agency to exercise the very same authority pursuant to general statutory grants that make no mention of hydraulic fracturing. *See Util. Air Regulatory Grp. v. EPA*, 134 S. Ct. 2427, 2444 (2014) (“When an agency claims to discover in a long-extant statute an unheralded power to regulate ‘a significant portion of the American economy,’ [the Court] typically greet[s] its announcement with a measure of skepticism. [The

Court] expect[s] Congress to speak clearly if it wishes to assign to an agency decisions of vast ‘economic and political significance.’”) (quoting *Brown & Williamson*, 529 U.S. at 159, 160). Indeed, as the district court observed, “the BLM has previously taken the position, up until promulgation of the Fracking Rule, that it lacked the authority or jurisdiction to regulate hydraulic fracturing.” Order at 15 (citing *Ctr. for Biological Diversity v. BLM*, 937 F. Supp. 2d 1140, 1156 (N.D. Cal. 2013)).

Appellants nevertheless argue that this conclusion would upset longstanding precedent supporting the exercise of agency authority. According to the federal appellants, for example, the BLM and its predecessors have been regulating resource extraction under the Mineral Leasing Act of 1920 (“MLA”) and the Federal Land Policy and Management Act (“FLPMA”) and “and modern hydraulic-fracturing operations simply are a new version of historically regulated well-stimulation techniques.” Federal Appellants’ Br. 2. But such historical generalities should not override Congress’ express intent as evidenced by EPAAct, which specifically and directly addressed the new context of hydraulic fracturing. “There can be no question that Congress intended to remove hydraulic fracturing operations (not involving diesel fuels) from EPA regulation under the SDWA’s UIC program.” Order at 21-22. The issue before this Court is whether Congress nevertheless intended BLM to exercise this same authority under the MLA and

FLPMA, which make no mention of the practice. It is inconceivable that Congress, having specifically withheld this authority from the federal agency with primary expertise in environmental regulation, would have nonetheless intended to bestow that same authority, without ever mentioning it, on agencies with only tangential experience with such issues. As the district court held, “[i]f agency regulation is prohibited by a statute specifically directed at a particular activity, it cannot be reasonably concluded that Congress intended regulation of the same activity would be authorized under a more general statute administered by a different agency.” Order at 22.

Appellants and their amici also argue that the authority to regulate hydraulic fracturing is essential to protect federal lands. *See, e.g.*, DOI Amicus Br. 23; Professors’ Amicus Br. 20. These arguments miss the mark. First, as the district court observed, “[t]he issue before th[e] Court is *not* whether hydraulic fracturing is good or bad for the environment or the citizens of the United States.” Order at 2. Regardless of a purported need for regulation, an agency “may not exercise its authority ‘in a manner that is inconsistent with the administrative structure that Congress enacted into law.’” *Brown & Williamson*, 529 U.S. at 125 (citation omitted). Thus, if there has been no delegation of authority, it is no answer to argue that the agency perceives a need to regulate.

But regardless, the question here is not whether some regulation of hydraulic fracturing may be advisable; the question is whether Congress intended an additional layer of *federal* regulation in addition to the authority already exercised by the States. As discussed below, *see infra* at 10-16, hydraulic fracturing is heavily regulated by the States, and no party has identified a regulatory gap that might require an additional layer of federal regulation. In fact, the EPA Act evinces precisely the opposite intent. As the district court observed, the Act is “a comprehensive energy bill addressing a wide range of domestic energy resources, with the purpose of ensuring jobs for the future ‘with secure, affordable, and reliable energy.’” Order at 21 (quoting Pub. L. No. 109-58, 119 Stat. 594 (2005) (codified at 42 U.S.C. § 15942)). It was intended “to *expedite* oil and gas development within the United States,” and to that end it established five new categorical exclusions from review under the National Environmental Policy Act (“NEPA”) that would apply to certain oil and gas development activities on federal oil and gas leases. *W. Energy All. v. Salazar*, 2011 WL 3738240, at *2 (D. Wyo. Aug. 12, 2011) (emphasis added). And to further promote the development of domestic oil and gas resources, Congress explicitly acted to *remove* the hydraulic fracturing process from federal agency oversight. This Court should not countermand that intent by holding that general grants of authority that make no mention of hydraulic fracturing trump Congress’s express determination that the

need to further promote domestic energy production warrants removing additional federal regulation over a field already fully occupied by the States.

II. EVEN IF BLM HAD AUTHORITY TO ISSUE THE RULE, IT FAILED TO ARTICULATE ANY RATIONAL CONNECTION BETWEEN THE RELEVANT FACTS AND ITS DECISION.

As explained above, the district court's order setting aside the BLM rule should be affirmed at the first step of the *Chevron* analysis, because the court correctly held that the BLM lacked Congressional authority to promulgate the regulations. Even if the agency had authority to regulate hydraulic fracturing, however, this Court should alternatively affirm the district court's order under the second step of the *Chevron* analysis. *See S. Utah Wilderness All. v. Dabney*, 222 F.3d 819, 826-27 (10th Cir. 2000) (finding that district court erroneously concluded the agency action was prohibited by Congress under the first step of the *Chevron* inquiry, and proceeding to step two of the analysis); *see also* North Dakota Br. 5 n.1, 34-39.

Under the Administrative Procedure Act ("APA"), 5 U.S.C. § 701 *et seq.*, an agency action is "arbitrary and capricious" if "the agency fails to 'examine the relevant data and articulate a satisfactory explanation for its action including a rational connection between the facts found and the choice made.'" *Sorenson Commc'ns, Inc. v. FCC*, 567 F.3d 1215, 1220-21 (10th Cir. 2009) (quoting *Motor Vehicle Mfrs. Ass'n of U.S. v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43

(1983)). “Federal administrative agencies are required to engage in ‘reasoned decisionmaking.’” *Michigan v. EPA*, 135 S. Ct. 2699, 2706 (2015) (quoting *Allentown Mack Sales & Serv., Inc. v. NLRB*, 522 U.S. 359, 374 (1998)). As a result, “[n]ot only must an agency’s decreed result be within the scope of its lawful authority, but the process by which it reaches that result must be logical and rational.” *Id.* (quoting *Allentown Mack*, 522 U.S. at 374); *see also Michigan v. EPA*, 135 S. Ct. at 2706 (“[A]gency action is lawful only if it rests ‘on a consideration of the relevant factors.’”) (citation omitted). “Review under the arbitrary and capricious standard is narrow in scope, but is still a ‘probing, in-depth review.’” *Sorenson Commc’ns*, 567 F.3d at 1221 (quoting *Qwest Commc’ns Int’l, Inc. v. FCC*, 398 F.3d 1222, 1229 (10th Cir. 2005)). The Court “must determine whether the agency considered all relevant factors and whether there has been a clear error of judgment.” *Olenhouse v. Commodity Credit Corp.*, 42 F.3d 1560, 1574 (10th Cir. 1994). Further, “[i]n determining whether [an agency’s] decision is supported by substantial evidence, the court must also consider that evidence which fairly detracts from the [agency’s] decision.” *Hall v. U.S. Dep’t of Labor*, 476 F.3d 847, 854 (10th Cir. 2007).

The BLM rule fails these tests. The agency failed to adequately explain any need for additional regulation, provided no evidence in support of the efficacy of its approach, and substantially underestimated the costs of compliance. Further, it

failed to balance the non-existent benefits of the BLM rule against the costs that this unnecessary regulation would impose on a critical sector of the U.S. economy. Because the BLM failed to articulate any rational connection between the relevant facts and its decision, the BLM rule should be set aside as arbitrary and capricious.

The BLM rule at issue focuses on three aspects of oil and gas development: (1) wellbore construction standards; (2) public disclosure of chemical additives; and (3) water management policies. It would set new federal standards for hydraulic fracturing on roughly 700 million acres of public land as well as 56 million acres of Indian land. *See* 80 Fed. Reg. at 16,129.

Each of these aspects of hydraulic fracturing, however, is already subject to comprehensive regulation under existing state and federal law. Although the BLM looked at how state regulations differed in some ways from one another and its proposed federal rule, *see* DOI Administrative Record (“AR”) 0004772, 0007893-94, 0045522-27, 0100575-80, the record contains no discussion at all of how any existing state regulations are inadequate to protect against the perceived risks to groundwater. In fact, the BLM failed to identify even a *single* state that currently does not have regulations adequate to achieve the objectives of the BLM rule.²

² Likewise, appellants and amici have failed to identify any state with inadequate regulations in their briefing to this Court. For example, amici acknowledge that “some States may have adequate regulations to protect the federal lands,” but argue that “others *may* not regulate hydraulic fracturing at all.” DOI Amicus Br. 32. Amici, however, provide no support for this contention.

Nor did the agency provide any evidence that its rule would be any more effective in practice than existing state regulations protecting water and other aspects of the environment. In fact, the record supports the opposite conclusion.³ Accordingly, even if it had the statutory authority that it claims, the BLM failed to provide a reasonable explanation as to why that authority should be exercised in an area already subject to extensive state regulation.

A. The BLM Rule Is An Unnecessary Intrusion Into An Already Heavily Regulated Field.

State governments historically have been the primary regulators of oil and gas development, a pattern that has remained consistent throughout the shale energy boom. *See* Nathan Richardson et al., Resources for the Future, *The State of State Shale Gas Regulation*, at 5 (June 2013) (www.rff.org/research/publications/state-state-shale-gas-regulation). In part, this is because the vast majority of hydraulic fracturing in the United States is done on state and private land and is governed by state and local regulations. Michael E. Porter et al., Harvard Bus. Sch., *America's Unconventional Energy Opportunity*, at 8 (June 2015) (“Only a small minority of [shale energy development] operations occur on federal lands

³ *See* DOI AR 0055854 (letter from Wyoming Congressional delegation referencing Secretary of the Interior Sally Jewell’s June 2013 testimony before the Senate Energy and Natural Resources Committee that she could not identify any state currently regulating hydraulic fracturing which was not doing a sufficient job); DOI AR 0001723, 0007036, 0009170, 0014055, 0026852, 0027636, 0052532-33, 0094637.

and are largely catching up to rules that states already have in place.”) (www.hbs.edu/competitiveness/Documents/america-unconventional-energy-opportunity.pdf). As a result, states have developed comprehensive regulations governing the development of shale energy resources. *See, e.g.*, Molly Feiden et al., Resources for the Future, *Hydraulic Fracturing on Federal and Indian Lands*, at 9 (Aug. 2013) (www.rff.org/research/publications/hydraulic-fracturing-federal-and-indian-lands-analysis-bureau-land-management) (“All western states with large shale gas reserves and significant federal land holdings regulate oil and gas development and have done so for decades.”). Where Congress has deemed it appropriate, the federal government also regulates aspects of the process.⁴

The BLM has not denied that state regulation of hydraulic fracturing is pervasive, nor has it provided evidence of a regulatory gap left by the states. Instead, the BLM’s rationale for imposing additional federal regulation in the area is that state regulation is not uniform. *See* 80 Fed. Reg. at 16,130, 16,133 & 16,154. But a desire for uniformity, in itself, is insufficient, given that the agency

⁴ For example, federal agencies enforce regulations regarding the potential impact of development projects on air quality and endangered species. *See, e.g.*, Clean Air Act, 42 U.S.C. §§ 7401-7431 (conferring authority on the Environmental Protection Agency to regulate potential threats to air quality); Endangered Species Act, 16 U.S.C. §§ 1531-1544 (requiring operators to consult with the U.S. Fish & Wildlife Service and potentially obtain an “incidental take” permit if the planned activity may affect a protected species); *see also* Richardson et al., *supra*, App. 2 at 6-11 (exploring the division of authority among levels of government regarding shale gas activities).

has pointed to no environmental or public health issue that its rules would address that is not already addressed by existing regulations.⁵ In these circumstances, the BLM’s rules would merely add to the disuniformity by imposing an additional layer of superfluous requirements that would increase the regulatory burden on operators while doing nothing at all to protect health or safety.

As the BLM recognized, absent preemption “[a]ll state laws apply on Federal lands,” and “[o]perators on Federal leases must comply both with [the BLM] rule and applicable state requirements.” 80 Fed. Reg. at 16,178. And state regulation of hydraulic fracturing is comprehensive and pervasive. Among other aspects, states regulate “the location and spacing of well sites, the methods of drilling, casing (lining), [hydraulic fracturing], and plugging wells, the disposal of most oil and gas wastes, and site restoration.” Richardson et al., *supra*, at 5. States use a variety of regulatory tools, “from command-and-control regulations to more

⁵ See Nathan Richardson et al., Resources for the Future, *The State of State Shale Gas Regulation*, Executive Summary, at 5 (May 2013) (www.rff.org/files/document/file/RFF-Rpt-StateofStateRegs_ExecSumm_0.pdf) (“Heterogeneity alone is not a bad thing, and is not necessarily surprising. But whether it is justified—in an economic and environmental sense—depends on whether it is rooted in underlying differences among states that affect the costs and benefits of policy choices (for example, differences in hydrology, geology, and demographics).”).

flexible performance standards and case-by-case permitting.” Richardson et al., Executive Summary, *supra*, at 2.⁶

The BLM provided no evidence that state regulations are inadequate in order to justify its heavy-handed intrusion on that authority. The agency raises the risk of groundwater contamination as a primary concern motivating many of its provisions. *See, e.g.*, 80 Fed. Reg. at 16,193-94. Yet the BLM has provided no discussion of how any existing state regulations are inadequate to protect against the perceived risks to groundwater. Indeed, the agency has been unable to identify a single groundwater contamination incident that the BLM rule would have prevented, nor offered any analysis measuring (or even estimating) the risk of environmental harm that the rule purports to prevent. Instead, the BLM rule is a solution in search of a problem.

As a Harvard Business School study noted, “[t]he federal government positioned the rules as a new blueprint for states to follow,” but “in reality most states are already leading.” Porter et al., *supra*, at 8. Indeed, the relevant states already have well-established regulatory regimes for oil and gas. In FY 2014, the BLM approved 3,769 applications for permit to drill on federal lands in 18 states.

⁶ For example, “a state might require wells to be cased and cemented to a specific depth below the water table (a command-and-control rule), to a level sufficient to protect all ‘freshwater bearing zones’ (a performance standard), or it might require each well’s casing and cementing to be reviewed before issuing a permit (case-by-case permitting).” *Id.*

Bureau of Land Mgmt., *Public Land Statistics 2014*, at 117, Table 3-16 (May 2015) (www.blm.gov/public_land_statistics/pls14/pls2014.pdf). Over 97% of the approved permits were for just seven states: California, Colorado, Montana, New Mexico, North Dakota, Utah, and Wyoming. Since the beginning of 2010, all seven of those states have revised their hydraulic fracturing regulations. *See* Cal. Code Regs. tit. 14, §§ 1780-1789; Colo. Code Regs. §§ 404-205, 404-205A, 404-305e(1)(A), 404-316C, 404-317, 404-341, 404-903, 404-904; Mont. Admin. R. 36.22.608, 36.22.1015, 36.22.1016, 36.22.1106, 36.22.1010; N.M. Code R. 19.15.16.19; N.D. Admin. Code 43-02-03-27.1; Utah Admin. Code r. 649-3-39; 55-3 Wyo. Code R. §§ 45(d)(iv), 45(d)(vi), 45(f), 45(g).

Of the eleven states that accounted for less than three percent of approved permits on federal and Indian lands, nearly all have amended their regulations for hydraulic fracturing. *See* Alaska Admin. Code tit. 20, §§ 25.005, 25.280, 25.283, 25.990; La. Admin. Code tit. 43:XIX § 118; 26-2 Miss. Code R. § 1.26; Nev. Admin. Code §§ 522.010-522.540; Ohio Admin. Code 1509.01-1509.99; Okla. Admin. Code §§ 165:10-3-4, 165:10-3-10, 165:10-7-16, 165:10-21-22; S.D. Admin. R. 74:12:02:19; 16 Tex. Admin. Code §§ 3.13, 3.29, 3.99, 3.100. From FY 2010 to FY 2013, the number of well completions in nine states—California, Colorado, Montana, New Mexico, North Dakota, Oklahoma, Texas, Utah, and

Wyoming—accounted for 99.3% of the total well completions on federal and Indian lands nationwide. 80 Fed. Reg. at 16,187.

As the data demonstrate, all the states in which any meaningful amount of hydraulic fracturing occurs on federal and Indian lands already heavily regulate the process. The BLM has failed to identify any gap in the existing regulations, because there is simply no “regulatory gap” for the BLM to fill, and its failure to provide a reasoned explanation as to why its rules were necessary in the absence of such a gap renders them arbitrary and capricious.

B. Compliance With The Overlapping State And Federal Regulatory Regimes Would Significantly Harm U.S. Businesses.

The BLM also failed to meaningfully weigh the costs of its proposed rule against the non-existent benefits. *See Michigan v. EPA*, 135 S. Ct. at 2707 (“Consideration of cost reflects the understanding that reasonable regulation ordinarily requires paying attention to the advantages *and* the disadvantages of agency decisions.”) (emphasis in original); *see also id.* (“No regulation is ‘appropriate’ if it does significantly more harm than good.”). Given the non-existent basis for federal intrusion into an area already comprehensively and effectively regulated by the states, the BLM erred by failing to adequately address the significant costs that this unnecessary regulation would impose on an industry already facing significant price decreases. *Cf. id.* (“One would not say that it is

even rational, never mind ‘appropriate,’ to impose billions of dollars in economic costs in return for a few dollars in health or environmental benefits.”).

If the BLM’s rule were allowed to go into effect, U.S. businesses in the shale energy industry would suffer at least two sources of immediate injury—the direct costs of compliance with multiple regulatory regimes, and harm from the disclosure of trade secrets and confidential information.

With respect to the former, the BLM has significantly underestimated the costs of compliance with virtually every aspect of its rule. According to the agency, the annual cost of complying with the BLM rule is approximately \$32 million. 80 Fed. Reg. at 16,130. Other analyses, however, found that the BLM estimate was wildly inaccurate. Even excluding elements such as water testing and fracture modeling costs, an evaluation by an outside economic consulting firm estimated the annual cost of compliance to be \$345 million. *See* Indep. Petroleum Ass’n of Am., *Comments on BLM’s Hydraulic Fracturing Rulemaking Proposal*, at 59 & n.92 (Aug. 22, 2013) (www.regulations.gov/#!documentDetail;D=BLM-2013-0002-5410); *see also id.* App. A (Economic Assessment by John Dunham & Associates). The BLM, moreover, arrived at its estimate by assigning compliance costs of zero to a number of requirements to which operators have never before been subject. *See, e.g.*, 80 Fed. Reg. at 16,198 (assigning incremental cost of “\$0” to requirement that operators perform mechanical integrity test (“MIT”)); *id.* at

16,160 (acknowledging that the MIT required by the rule “is not equivalent” to the pressure tests that operators currently perform); *id.* at 16,142 & 16,196 (assigning incremental cost of “\$0” to redefinition of “usable water” that imposes additional burdens on operators). This assertion—that operators will somehow be able to comply with costly regulations for nothing—evidences the speculation, rather than reasoning, underlying the BLM rule.

In addition, the harm to U.S. businesses that are forced to disclose valuable trade secrets and confidential information may be incalculable. The BLM rule represents a significant expansion of the information that oil and gas developers are required to disclose publicly, both before and after operations. *See* 80 Fed. Reg. 16,128 (“Key changes to the final rule include . . . more stringent requirements related to claims of trade secrets exempt from disclosure . . . [and] additional disclosure and public availability of information about each hydraulic fracturing operation[.]”). Operators would be required to disclose operational information about the location where drilling will take place, the water resources in the vicinity of operations, the location of other wells and natural fractures or fissures in the area, and the operator’s fracturing plans, including the amount of fluid to be injected, the pressure to be applied to the formation, and the estimated length, height, and total vertical depth of the fractures. *See* 43 C.F.R. §§ 3162.3-3(d)(1)-(7), 3162.3-3(i). For many businesses, confidential information relating to

geology and extraction techniques is the source of their competitive advantage. Forcing businesses to disclose this information—with no meaningful assurance of confidentiality—could be financially devastating.⁷ See *FMC Corp. v. Taiwan Tainan Giant Indus. Co., Ltd.*, 730 F.2d 61, 63 (2d Cir. 1984) (per curiam) (“A trade secret once lost is, of course, lost forever.”).

Apart from these immediate costs, U.S. businesses would be forced to comply with overlapping layers of regulation that may duplicate or even contradict existing regulations. If the BLM rules are different from state or tribal regulations, “operators would appear to be left with two layers of regulation,” which “may require operators on federal lands in many cases to interact with multiple layers of government.” Feiden et al., *supra*, at 9. Even if the BLM rule does not impose additional *substantive* requirements in a particular case, it would impose additional *procedural* burdens. For example, “BLM could require operators to undergo a

⁷ Although the BLM has provided a mechanism for operators to protect the confidentiality of information in the completion reports that are submitted *after* hydraulic fracturing, *id.* § 3162.3-3(j), there is no similar regulatory protection for information required to be submitted *before* hydraulic fracturing. The preamble to the BLM rule suggests that an operator “may segregate the information it believes is a trade secret, and explain and justify its request that the information be withheld from the public.” 80 Fed. Reg. at 16,173. The language of the BLM rule itself, however, is more limited. The provision allowing operators to withhold information from disclosure, 43 C.F.R. § 3162.3-3(j), applies only to information required to be submitted under § 3162.3-3(i). Subsection (i) identifies information that must be disclosed *after* hydraulic fracturing operations have been completed. There is no similar provision in the BLM rule to protect information that must be submitted *before* hydraulic fracturing operations have begun.

separate permit process with identical (or weaker) standards than states, or to submit documents in different formats than state require.” *Id.* at 11. As a recent analysis of the proposed BLM rule advised, “[s]uch procedural burdens should not be ignored—they impose costs on operators without any direct environmental or public health benefit.” *Id.*

And the costs are not limited to the business community—tribes and U.S. taxpayers would suffer economic losses in the form of substantially decreased royalties and tax revenues. Drilling on federal lands will take longer and cost more as the regulatory hurdles increase. By increasing the layers of approval necessary to develop and produce oil and gas on federal and Indian lands, the BLM’s rule creates a disincentive to invest in federal and tribal oil and gas leases, and instead drives operators towards production on non-federal land that is governed by greater regulatory certainty. This would only exacerbate what has already emerged as an existing trend.

In practice, the states have far more experience than federal agencies at efficiently managing oil and gas development. In Texas, for example, an operator can generally obtain a drilling permit in 2 to 5 days, while the BLM often measures its timeline in *years*. The BLM’s own statistics reveal the staggering disparity—162 days between receipt of an APD and approval in Farmington, New Mexico; 211 days in Canon City, Colorado; 233 days in Lander, Wyoming; 359 days in

Milwaukee, Wisconsin; 518 days in Kemmerer, Wyoming; 635 days in Moab, Utah; and 952 days in Buffalo, Wyoming. Zimmerman & Leggette, *Western Lands and Energy Newsletter*, Fig. 3 (June 26, 2013). The BLM rule would only make matters worse. The agency estimates that merely reviewing the paperwork required by the rule “will pose an additional workload to the BLM of about 25,400 hours per year.” 80 Fed. Reg. at 16,207. And as shown above, the BLM provided no evidence showing that these more efficient state regulatory regimes have been insufficient to protect public health or safety.

For states with minimal amounts of federal land, like Texas, the inconvenience and delay of operating on federal lands may lead operators to develop resources on non-federal lands elsewhere in the state. But the regulatory burden of the BLM rule is particularly acute for states like Nevada and Wyoming, where between 80-98% of the land in some counties is under federal management, and for tribes like the Ute, which rely on energy production as the primary source of funding for tribal government services.⁸ For these communities, as with many U.S. businesses, complying with the proposed BLM rule could lead to substantial economic losses.

⁸ See DOI AR 0021123-24, 0028351-52, 0030226, 0051050, 0056291, 0057066, 0104456; DOI PS 0000910 (letter from Lincoln County, Nevada, stating that more than 98% of county is under federal management); DOI PS 0009100 (80% of Park County, Wyoming, is federal land with more than half of its assessed valuation coming from oil and gas development); DOI PS 0010267, 0010570-71.

C. The BLM Rule Unnecessarily Diminishes The Major Economic And Strategic Benefits Of Hydraulic Fracturing To The U.S. Economy.

In addition to the significant costs of complying with overlapping state and federal regulatory regimes, the BLM failed to meaningfully consider another significant disadvantage of its decision. If allowed to take effect, the BLM rule would unnecessarily diminish the major economic and strategic benefits of hydraulic fracturing to the U.S. economy without providing any additional protection for the environment or public health. Because the agency failed to weigh this harm against the non-existent benefits of the BLM rule, the decision of the BLM should be set aside as arbitrary and capricious. *See Michigan v. EPA*, 135 S. Ct. at 2707.

Hydraulic fracturing has singlehandedly changed the role of the United States in the world's energy markets. Since 2012, the U.S. has been the world's top producer of petroleum and natural gas. U.S. Energy Info. Admin., *United States Remains Largest Producer of Petroleum and Natural Gas Hydrocarbons* (May 23, 2016) (www.eia.gov/todayinenergy/detail.cfm?id=26352). After the 40-year-old oil export ban ended in 2015, U.S. crude is now being sold on world markets. Natural gas produced from shale has been increasingly exported from the U.S. to Mexico and Canada and recently shale gas (in the form of liquefied natural gas) began being exported worldwide. In its *Annual Energy Outlook 2015*, the

Energy Information Administration projects that the U.S. will be a net natural gas exporter by 2017, and remain that way through 2040. U.S. Energy Info. Admin., *Annual Energy Outlook 2015 with projections to 2040*, at ES-1 (Apr. 2015) ([www.eia.gov/forecasts/aeo/pdf/0383\(2015\).pdf](http://www.eia.gov/forecasts/aeo/pdf/0383(2015).pdf)).

On a national level, the development of shale oil and gas reserves through hydraulic fracturing has created unprecedented economic opportunities. According to one study, the development of unconventional oil and gas resources via hydraulic fracturing adds more than \$430 billion to annual U.S. GDP—nearly equal to the GDP of the entire state of Ohio. Porter et al., *supra*, at 6. It also has supported more than 2.7 million American jobs that paid, on average, nearly twice the median U.S. salary. *Id.* at 3. By comparison, the entire U.S. economy has only added 4.9 million new jobs since 2005. *Id.* at 6. And the federal tax revenue paid from unconventional oil and gas development reduces the federal budget deficit by 13% compared to what it would be without such revenue. *Id.* at 7.

For many state and local communities, shale energy development has helped turn struggling regions into newly thriving communities. In areas such as North Dakota, Western Pennsylvania, Eastern Ohio, Oklahoma, and West Texas, shale energy development supports local industries, real estate, local services, and other community needs, such as schools. *Id.* In North Dakota—home of the oil-rich Bakken Shale—the unemployment rate in February 2016 was 2.9%, well below the

national average at that time of 4.9%. Sean Hackbarth, U.S. Chamber of Commerce, *Why is Fracking a Dirty Word? An Explainer on America's Shale Energy Boom* (Apr. 19, 2016) (www.uschamber.com/above-the-fold/why-fracking-dirty-word-explainer-america-s-shale-energy-boom). In Pennsylvania—home to the Marcellus Shale—six counties where 751 natural gas wells were drilled and developed using hydraulic fracturing techniques all had lower unemployment rates than the state average in 2014. *Id.*

Moreover, the additional economic impact of the “midstream” and “downstream” sectors of shale energy development—like manufacturing, petrochemical, and pipeline industries—has made shale energy one of the most important forces driving U.S. economic growth. See IHS, *America's New Energy Future: The Unconventional Oil and Gas Revolution and the US Economy, Vol. 3: A Manufacturing Renaissance* (Sept. 2013) (www.energyxxi.org/sites/default/files/pdf/Americas_New_Energy_Future_Phase3.pdf). Shale energy also provides one of the largest “employment multipliers” in the U.S.—for every job created in the shale energy sector, more than three jobs are added in other areas. Inst. for 21st Century Energy, *Shale Energy: An Economic Success Story in the Making* (www.energyxxi.org/sites/default/files/shale_energy_economic_success.pdf). By 2025, the full “value chain” of shale energy—from upstream energy development through energy-related chemicals—is projected to support 3.9 million jobs and add

more than \$533 billion to annual U.S. GDP. IHS, *America's New Energy Future*, Vol. 3, *supra*, at 69. And between 2012 and 2025, shale energy is expected to contribute more than \$1.6 trillion in state and federal government revenues. *Id.*

Between 2012 and 2035, state economies have been projected to receive more than \$5.1 trillion in capital expenditures for unconventional oil and natural gas activity. IHS, *America's New Energy Future: The Unconventional Oil and Gas Revolution and the US Economy*, Vol. 2: *State Economic Contributions*, at v (Dec. 2012) (www.energyxxi.org/sites/default/files/Americas_New_Energy_Future_State_Main_Dec12.pdf). For states such as Texas and Oklahoma, with long histories of oil and gas production, and a combined total of 650,000 jobs linked to unconventional energy development in 2012, *id.*, the state-level impacts from shale energy development are clear. In Oklahoma, unconventional oil and gas activity generated \$1.3 billion in state and local taxes in 2012, which is the equivalent of roughly 17.5% of the state's budget for that year. IHS, *America's New Energy Future, State Economic Contributions: Highlights*, at 31 (Dec. 2012) (www.energyxxi.org/sites/default/files/Americas_New_Energy_Future_State_Highlights_Dec2012.pdf). In Texas, it generated \$10.2 billion in state and local taxes, or roughly 24% of the state's total budget. *Id.* at 37.

Even non-producing states receive significant economic benefits from the development of shale energy by virtue of the lengthy supply chain supporting the

industry. “Among non-producing states, fabricated metal manufacturing in Illinois, software and information technology in Massachusetts, and financial services and insurance in Connecticut are examples of central players in the US unconventional oil and gas supply chain.” IHS, *America’s New Energy Future*, Vol. 2, *supra*, at vi. For Florida, a state with no shale resources of its own, shale energy development in *other* states supported over 36,500 jobs and generated over \$180 million in state and local taxes. IHS, *America’s New Energy Future*, *State Economic Contributions: Highlights*, *supra*, at 54.

For consumers, declining energy prices (driven by the increased production from shale) have lowered the cost of living. *See* U.S. Energy Info. Admin., *Declining Energy Prices Lower the Cost of Living* (May 3, 2016) (www.eia.gov/todayinenergy/detail.cfm?id=26072). According to a 2015 study, “the shale gas revolution has led to an increase in welfare for natural gas consumers and producers of \$48 billion per year.” Catherine Hausman & Ryan Kellogg, Brookings, *Welfare and Distributional Implications of Shale Gas* (Mar. 19, 2015) (www.brookings.edu/about/projects/bpea/papers/2015/welfare-distributional-implications-shale-gas). In 2014, “American households were estimated to enjoy about \$800 in annual savings from lower energy costs attributable to unconventional natural gas, and to reap additional savings from lower oil prices.” Porter et al., *supra*, at 7. Because U.S. households making less than \$30,000

annually spend 23% of their after-tax income on energy, while households making more than \$50,000 annually spend only 7% of their after-tax income on energy, these savings provide the greatest benefit to lower-income Americans. *See* Am. Coal. for Clean Coal Elec., *Energy Cost Impacts on American Families*, at 1 (June 2015) (americaspower.org/sites/default/files/Trisko-National-Family-Energy-Costs-June-2015-FINAL.PDF).

Across the country, U.S. manufacturers have reaped the benefits of hydraulic fracturing as well. Industrial energy costs have fallen and manufacturers have seen their supply costs drop. As a result, many domestic and international companies are electing to build new factories and make other significant investments in the U.S. For example, the American Chemistry Council recently announced that U.S. chemical industry investment linked to plentiful and affordable natural gas from shale has reached \$164 billion, and estimated that the capital spending could create 738,000 new jobs by 2023. Am. Chemistry Council, *New U.S. Chemical Industry Investment Linked to Shale Gas Tops \$164 Billion* (Apr. 6, 2016) (www.americanchemistry.com/Media/PressReleasesTranscripts/ACC-news-releases/US-Chemical-Industry-Investment-Linked-to-Shale-Gas-Tops-164-Billion.html). Other studies indicate that lower costs for energy and raw materials are driving investments, such as new iron and steel plants and plastics processing, and renewing interest in the use of natural gas in transportation. Porter et al., *supra*, at

8. And because natural gas is the primary feedstock for fertilizer production, an increase in natural gas production will lower the price of fertilizer, which provides a direct benefit to U.S. agriculture. Charles F. Mason et al., Resources for the Future, *The Economics of Shale Gas Development*, at 3 (revised Feb. 2015) (www.rff.org/files/sharepoint/WorkImages/Download/RFF-DP-14-42.pdf).

Finally, the Nation has realized significant geopolitical benefits from the development of shale energy. According to the Chamber's U.S. Energy Security Risk Index, U.S. energy security has improved for three consecutive years. Inst. for 21st Century Energy, *Index of U.S. Energy Security Risk*, at 3 (2015) (www.energyxxi.org/sites/default/themes/bricktheme/pdfs/USEnergyIndex2015.pdf). Today, the U.S. imports only 10% of its energy, compared with 30% a decade ago. *Id.* at 4. This reduction is directly attributable to advances in hydraulic fracturing, which now accounts for 51% of U.S. crude production. Thomas J. Donohue, U.S. Chamber of Commerce, *Setting the Record Straight on Fracking* (Mar. 21, 2016) (www.uschamber.com/above-the-fold/setting-the-record-straight-fracking). Fewer imports not only diminish the power of energy cartels like OPEC, but reduce U.S. reliance on potentially unfriendly regimes as well. Mason et al., *supra*, at 11-12. And, because U.S. energy development and the associated manufacturing renaissance is increasingly export-oriented, *see* Am. Chemistry Council, *supra*, it

has the power to reduce the U.S. trade deficit and open up new avenues for trade and diplomacy abroad.

All these benefits are threatened by the BLM's unnecessary foray into an area already adequately regulated by the states. The hydraulic fracturing industry has always been particularly sensitive to cost increases such as those that would be imposed by the BLM's regulations, and this sensitivity has only increased in light of the dramatic fall in oil prices that began in 2014. *See BDO, 2015 BDO Oil and Gas Riskfactor Report*, at 2 (2015) (www.bdo.com/getattachment/e8cf6d7b-8614-4fe3-bfc8-9d1fb6b41967/attachment.aspx) (finding that 96% of the 100 largest publicly traded U.S. oil and gas E&P companies identified "hydraulic fracturing regulation" as a significant risk factor in 10-K filings with the SEC, up from only 52% in 2011); *id.* at 1 ("[L]ow prices are dampening companies' enthusiasm for investing and expanding—and amplifying the potential impact of impediments to future growth.").

Accordingly, by overstepping its authority into an area that Congress never intended the agency to regulate, and arbitrarily implementing a costly and unnecessary rule that overlaps with existing state regulations, the BLM's rule threatens to significantly harm the U.S. economy. And given that low-income consumers benefit the most from the economic benefits of hydraulic fracturing, the cost of these superfluous regulations would disproportionately impact the poor,

essentially amounting to a regressive tax. *See Obama Administration's New Fracking Rules Hurt The Poor*, Investor's Bus. Daily, Mar. 23, 2015 (www.investors.com/politics/editorials/epa-fracking-regulations-costly-to-poor/) (suggesting that "the biggest victims of [the BLM rule] will be the poorest Americans, who'll have to pay higher energy costs"). Because the agency failed to meaningfully consider the significant disadvantages of its decision, the BLM rule should be set aside as arbitrary and capricious. Thus, even if the agency had authority to regulate hydraulic fracturing (which it did not), this Court should nonetheless affirm the order of the district court.

CONCLUSION

For the foregoing reasons and those in the appellees' briefs, the Court should affirm the order of the district court, setting aside the BLM rule related to hydraulic fracturing on federal and Indian lands.

Respectfully submitted,
